Click-up/ Kanban Evidence

Laprecious Sanders

Habit Garden App

Board: ClickUp Kanban Board

URL (both just in case): https://sharing.clickup.com/90141801146/b/h/2kydxenu-534/2b00a43acb3eb9a

https://app.clickup.com/90141801146/v/b/2kydxenu-534

Statuses: Backlog, To Do, In Progress, Review/Testing, Done

WIP Limit: In progress = 1 (assignment requirement, not my preference)

Definition of Done:

- Most/ all implementation complete
- Feature met most of requirements
- Feature may need more connections later

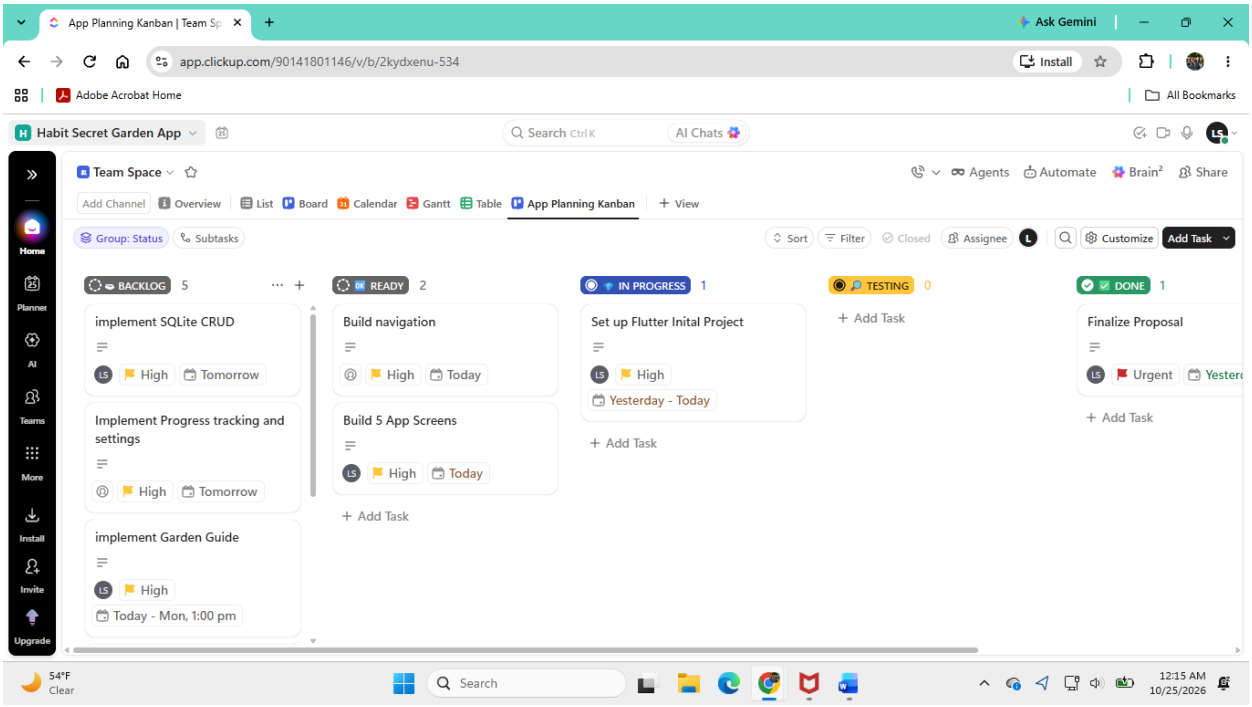

Mapping:

Team size: 1

Owner/developer: Laprecious Sanders

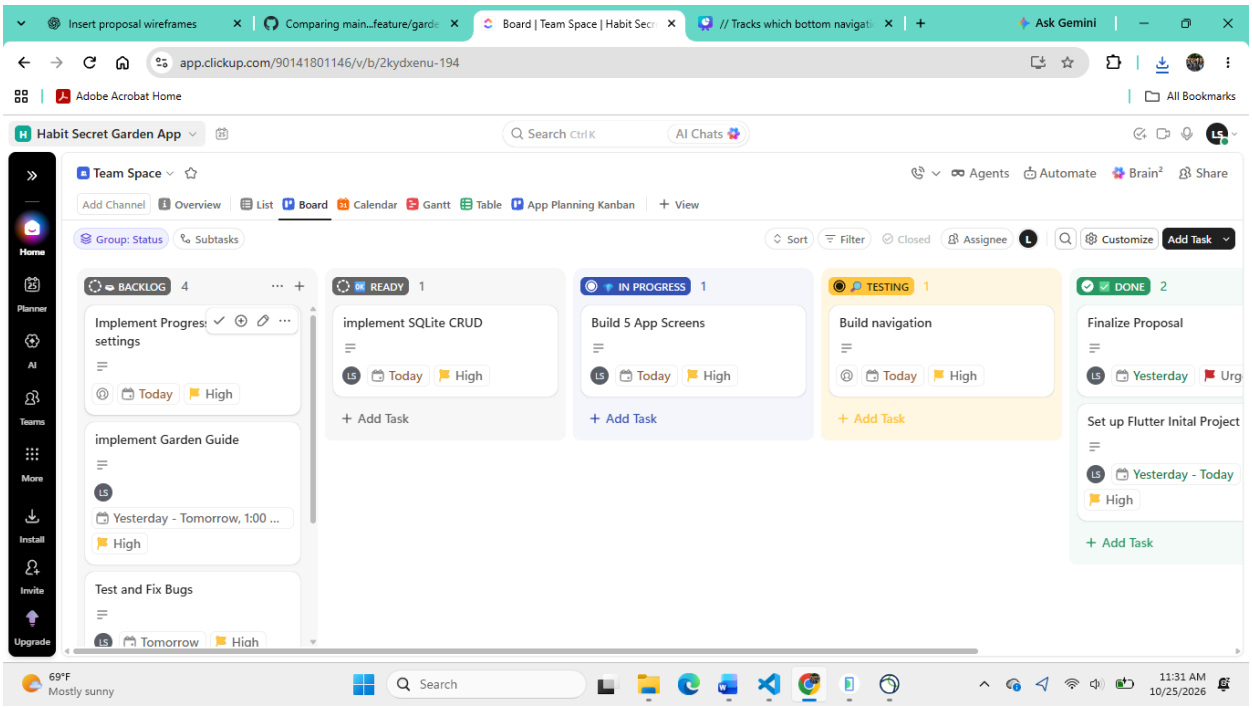

Responsibilities: ALL

Proposal:

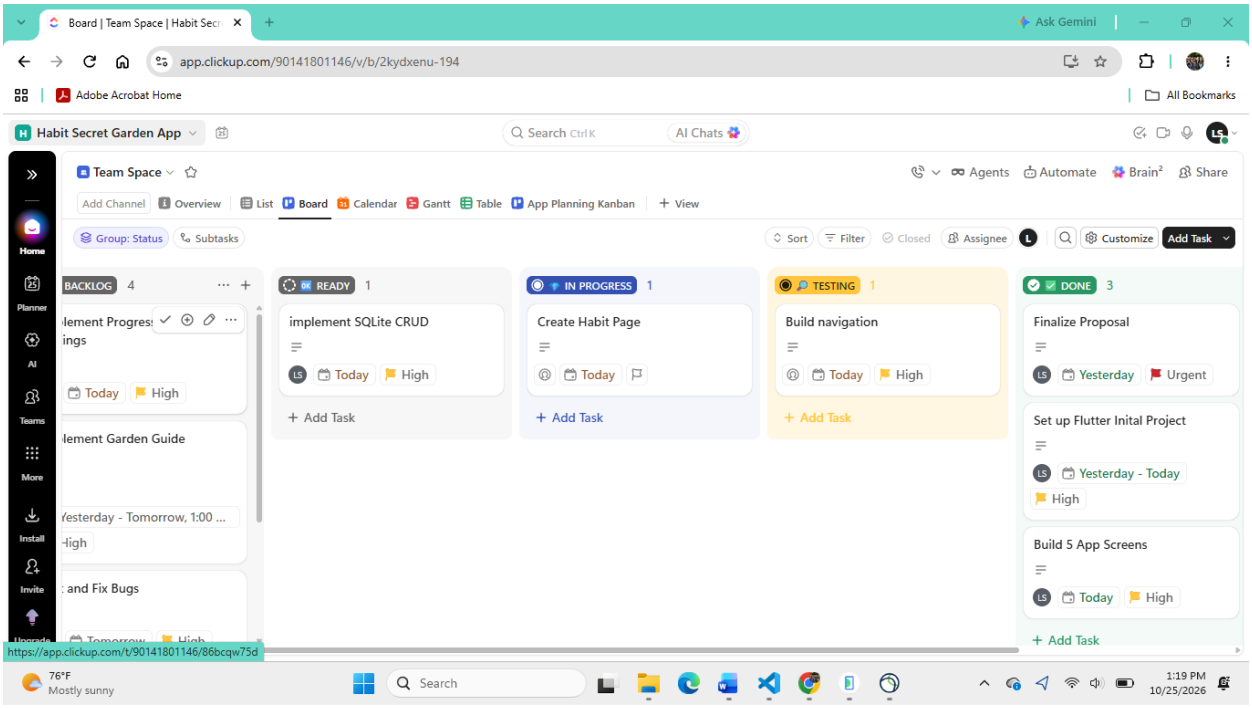

1. Initialization/ start up of Kanban Board set-up and finalizing Proposal final steps

UI/ Navigation:

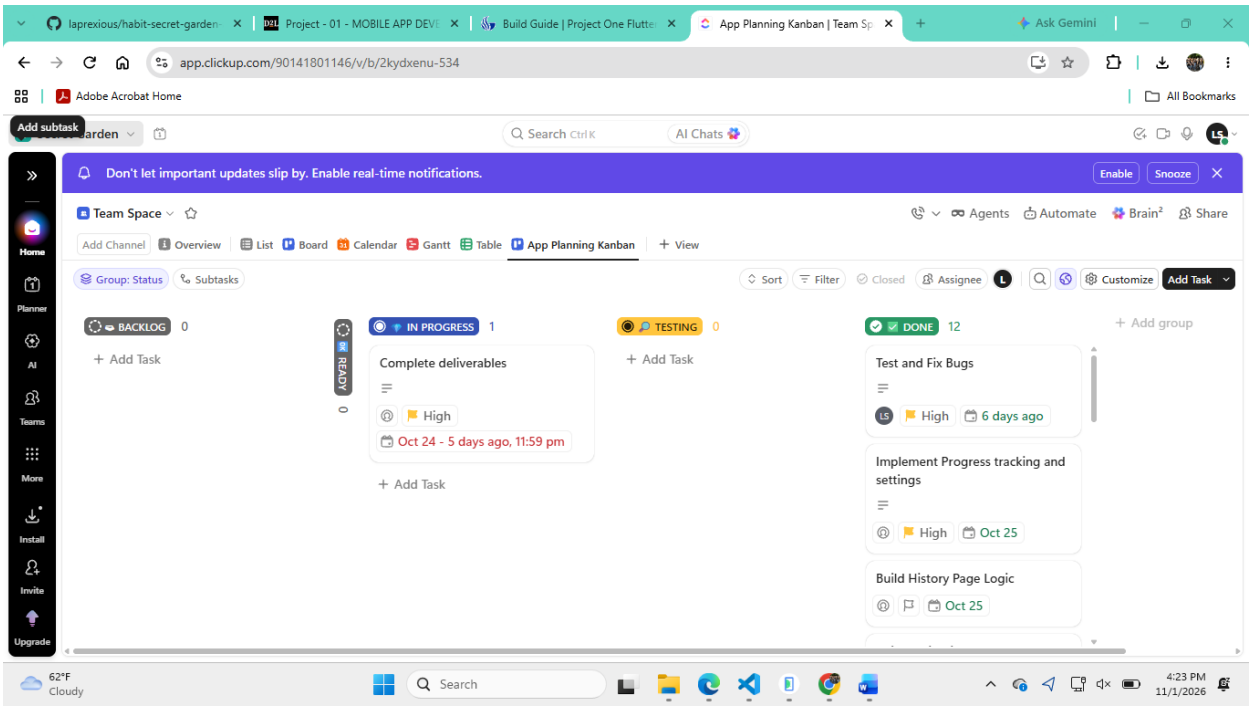

2. Started project by building out 5 screens and their filler templates. No major information, just getting the widgets and screens under one workspace and skeletons for each screen.

CheckPoint:

3. Tested five screens to ensure connection and navigation between all of them and started on the Create Habit page while still testing and ensuring navigation worked between all

Final Board:

- Ending Kanban Board showing build is completed.

Task-to-Build Trace

Title: Build 5 App Screens/ 86bcqw751

Owner: Laprecious Sanders

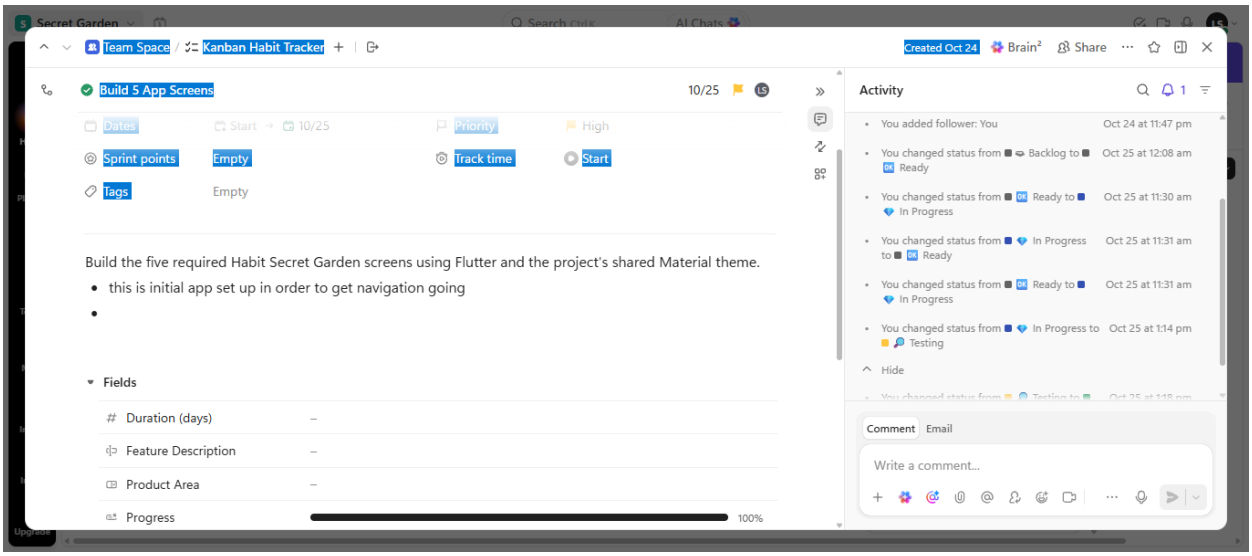

Acceptance Criteria: “ Build the five required Habit Secret Garden screens using Flutter and the project's shared Material theme (this is initial app set up in order to get navigation going)

Commit Reference:

f19ff5d800d89714e9a494e63b24eb69cebabbba

52192a030f19a52533a81c41992124d9edde4979

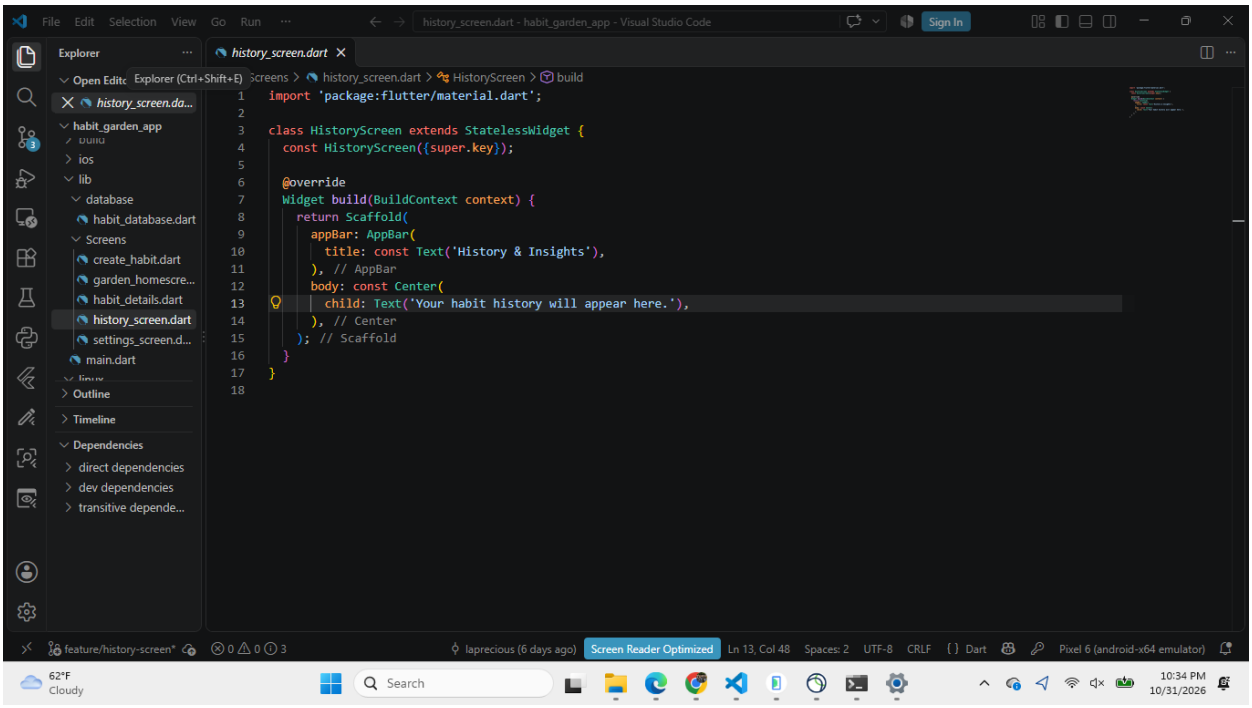

ClickUp Movement:

Test/Review: All screen skeletons functioning and connected to main.dart file.

Main.dart file connects to homescreen and ready for navigation

Completion/ Evidence (sample skeleton code):

NO Blockers to indicate

Local CRUD:

Title/ID: Build Habit Details Page/ 86bcr1h48

Owner: Laprecious Sanders

Acceptance Criteria: page is up and working, Ui is complete and cohesive start to the app with image packs

Commit/Git Reference:

96c7081c7a0cb9bc3061040124ed5b02871fdf52

b7e13705039e513d794f113596f380d8cd01f556

3111d439ddfbe4ed3336f95d43fabf20140dc575

Etc.

Code reference: (get date reference for storage)

```
130 +
131 +   Future<List<String>> getCheckInDatesForHabit(int habitId)
    async {
132 +     final db = await instance.database;
133 +
134 +     final results = await db.query(
135 +       'check_ins',
136 +       columns: ['checkInDate'],
137 +       where: 'habitId = ?',
138 +       whereArgs: [habitId],
139 +     );
140 +
141 +     return results.map((row) => row['checkInDate'] as
    String).toList();
142 +   }
143 +
144   }
```

This is telling the app to access the database and call a query for check ins. And to pull them by ID name since your in that particular habit in a row format. Essentially it is a method that to pull/ access a habits check ins for the week.

Test/ Review: all buttons functioning, all planned widgets implemented and check in works and saves to database. We test this through going back to home screen and count and percentage update! And numbers are updating with app reload.

Smart Helper:

Title/ID: **(NO kanban Section for this)** (forgot to add until after)

Owner: Laprecious Sanders

Acceptance Criteria: meets assignment qualifications and works

Commit/Git Reference:

ee1781687a5af14347bd3a685b4b7c8c49ec3763

b010dd410df6caa1a93ed35dff84bc7c30aae6d5

Also all commits After this one reference the AI helper.

Code reference:

```
    });
  }
  // Garden Guide method
  Widget _gardenGuideCard() {
    if (_habit['startedLocalDate'] == null) {
      return const SizedBox.shrink();
    }

    if (_gardenGuideSuggestion == null) {
      return Container(
        padding: EdgeInsets.all(16),
        child: Text(
          'Garden Guide: Not enough history yet. Keep checking
          textAlign: TextAlign.center,
        ), // Text
      ); // Container
    }

    final suggestion =
        _gardenGuideSuggestion!['suggestedTarget'] as int;
    final counts =
        _gardenGuideSuggestion!['weekCounts'] as List<int>;

    return Container(
      padding: const EdgeInsets.all(18),
      decoration: BoxDecoration(
        color: const Color.fromARGB(175, 231, 211, 163),
        borderRadius: BorderRadius.circular(16)
```

Here we are calling the gardenguidesuggestion method in our widget build. If the date is not valid/ NULL then the box shrinks in general, but if the suggestion itself is null, the widget build s a text box containing the info regarding not having enough history. Otherwise the final suggestions given by the AI helper are determined by the calculated suggestedTarget. (Which is calculated using average check ins-per week earlier in code)

Test/ Review; works in testing document/ and with current edge cases. Original Code did not work; after using test file and researching on google, I concluded I needed to account

for daylight savings and I reconfigured the code and requirements to include days instead of hours.

Testing/ debugging

Title/ID: Test and Fix Bugs / 86bcqw75q

Owner: Laprecious Sanders

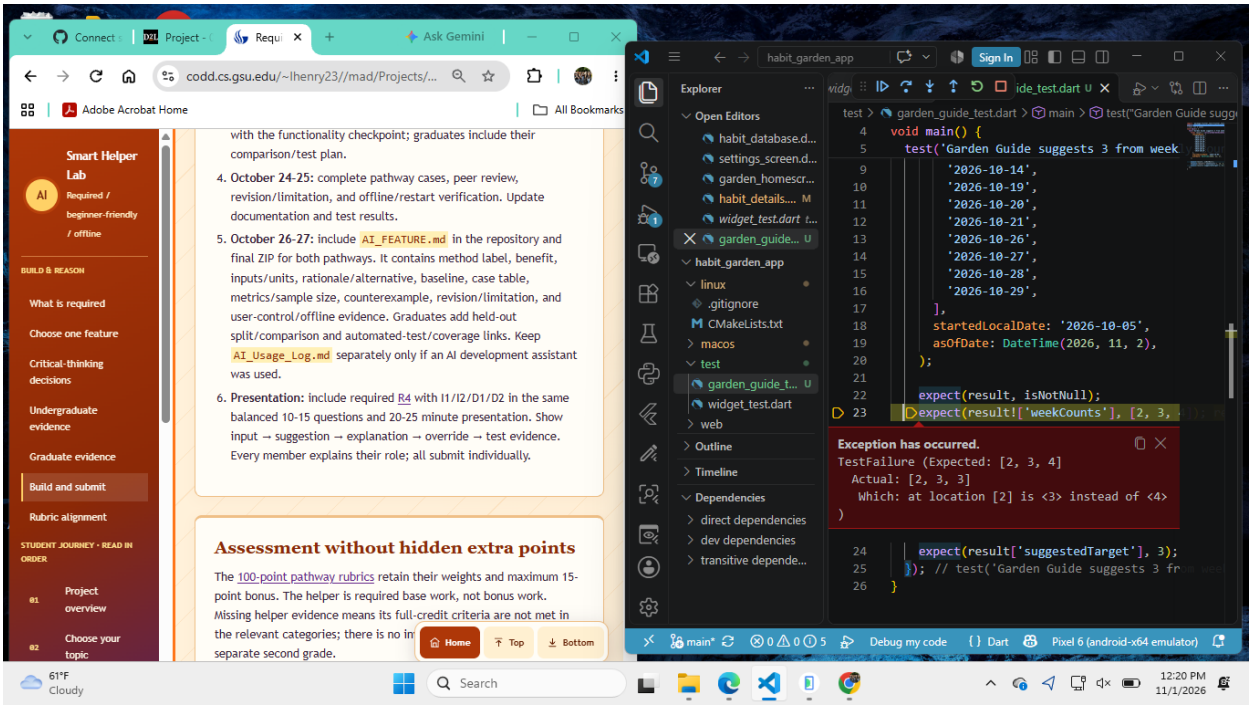

Acceptance Criteria: All presenting issues are troubleshooted

Commit/Git Reference: This really wasn't tracked well as I did not save bug fixe for the end. Instead, I fixed bugs as I developed and ran into them so I was always testing and always had this Clickup Section in the testing area because I was constantly testing things and trying different things though my process (sizing issues, ensuirng buttons functioned, and formulas worked correctly, etc)

b010dd410df6caa1a93ed35dff84bc7c30aae6d5

Most of my debugging was done in real time as I ran into bugs within the app. I have images of me testing out and fixing what were errors that I will include. But I don't have individual commits for bug fixes because I was always in the testing phase.

evidence (debugging in real time)

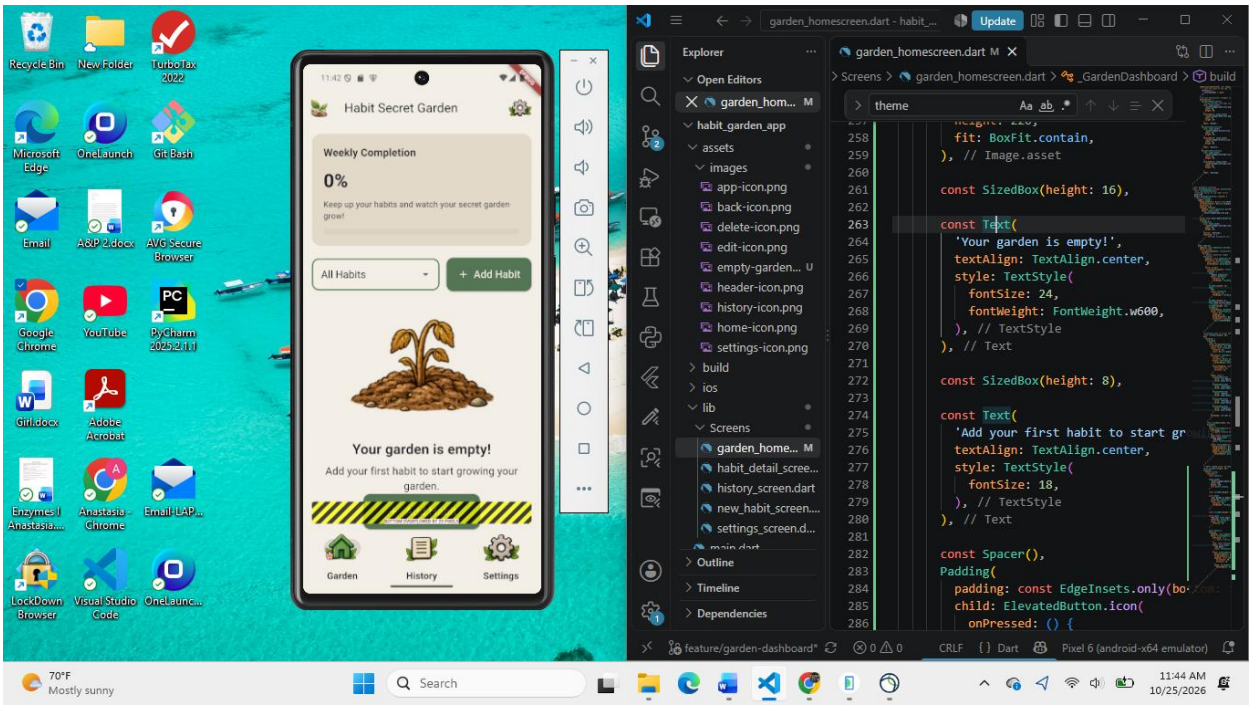

:- this was a bug I found inside my calculation for the AI helper. After debugging I found out I needed to account for daylight savings time to fix calculations and get expected results.

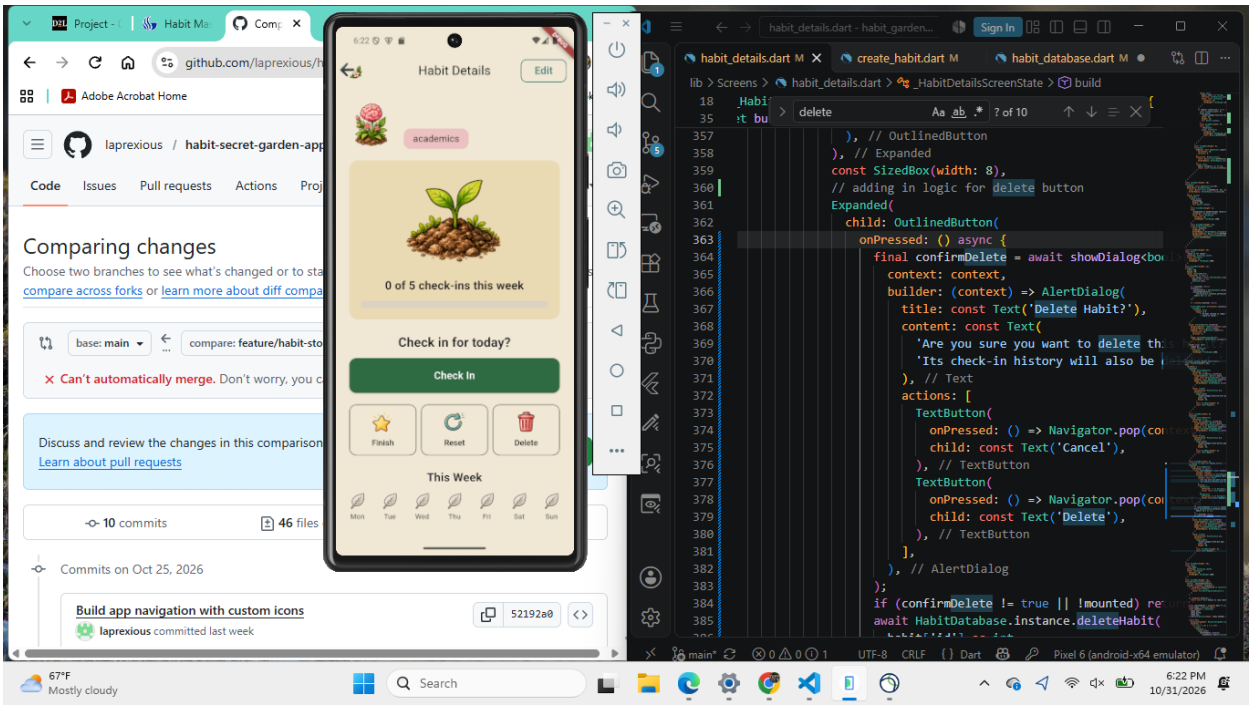

I did not have any data from three weeks ago, and since the app does have limited functionality; testing the 5 cases was more sufficient to do in a test file. In doing so I was able to simulate check ins for 5 different cases and what the AI Guide would do in the event it reached one of those cases. I quickly found this bug in one of the early cases; and reconfigured the calculation and code several times as I could not figure out what it was. After a quick google search, I concluded my calculation/logic did not account for the time change and thus from there I was able to debug and move forward with test 3.

Test/ Review: Went through entire app to ensure every button functions. Double checked previous bug fixes, and ensured new settings would still allow the user to run the app normally.

Extra bug I had that I worked through (no longer present in app)

Discovered this error/bug only when I deleted all my habits; without initializing; I would not have seen this sizing issue (early dev)

Logic was not accurately connecting to my buttons (they weren't functioning; I troubleshooted that in real time)
